Defining Cultural Sustainability in Multicultural Built Environments

David Beynon
Defining Cultural Sustainability in Multicultural Built Environments

David Beynon, Deakin University, Victoria, Australia

Abstract: The Australian built environment is an arena where multicultural identity and difference are tangibly negotiated. What occurs on a daily basis in its cities is a complex series of negotiations between multiple communities, all of whom adapt their own cultures, as well as adopting elements from their surrounding environment. This paper investigates these issues by comparing the physical development within a contemporary Australian city with the social and cultural changes that have taken place in it. It asks the question. Whose culture should be sustained in this context, and on what basis? To what extent should the urban environment be reflecting of the changes, as much as the origins, of a relatively young settler society (notwithstanding the fact that its original inhabitants have a history that predates this settlement by thousands of years). More broadly, what constitutes cultural sustainability in a multicultural society, and how is, might, or should this be reflected in its built environment?

Keywords: Cultural Sustainability, Built Environment, Multiculturalism

A SERIES OF United Nations conferences on the relationship between culture and sustainability arrived at the 2002 Kanazawa Resolutions, making the statement that sustaining cultures in terms of contemporary life is a matter of ‘dialogical coexistence’ and that cultural sustainability is not just a matter of the preservation or rein-vigoration of the past, but an ongoing dialogue between a locality and the people who inhabit or otherwise interact with it. Cultural sustainability is inextricably linked to notions of cultural heritage, a concept now recognised at an international level as being linked to ideas of cultural diversity, pluralism, and culture more generally as a ‘fluid process of forming, expressing, and enforcing identities of individuals, social groups, or spatially constructed communities. The built environment is an integral part of this spatial construction, and the history of building is a history of identity. “On the one hand, buildings exist as stand-alone artifacts, and on the other, they are artifacts that express the deep meanings, aspirations, and social order of a culture.”

Alterations to buildings, like their original construction, involve elements and forms that relate to particular cultural and societal patterns, a process that is not without contention. As Worthing and Bond note;

… a building can symbolically represent the development and or values of particular factions and therefore play a positive role in reinforcing notions of community identity.

However, it can have the opposite effect, and polarise and exclude by reinforcing and validating a particular view of the past.5

This idea that reinforcement of identity can be exclusive and polarising is one made by cultural critic and philosopher Ghassan Hage in relation to Australian society and its comparatively recent diversification. Hage argues that while Australia’s identity is now arguably multicultural, immigrants from non-British origins still have to contend with the persistent notion that Australian culture remains a received and adapted British (English) society.6 In a sense, this is not surprising, given the comparatively recent (1967) repealing of the 1901 Immigration Restriction Act, “part of a consistent campaign to prevent anyone from contributing to Australian nation-building who was not of European descent and appearance.”7 While this race-based national ideology has now been dismantled and discredited, Australia’s ongoing retention of the Queen of England as head of State and the Union Jack on its flag, indicate that the basis for its nationhood has not fundamentally changed. Multiculturalism may have added respect for other cultures that might exist within the nation, but the allowance and even encouragement of recent immigrants to retain their own identities does not necessarily equate to a share in the ‘ownership’ of the national space.8 The complexities of multicultural identity can be seen in many of Australia’s urban areas, so the built environment provides a useful subject with which to explore Hage’s theories about the nature of Australian multiculturalism, as well as issues of cultural sustainability more generally.

This paper will explore this contested territory through discussion of Richmond, one of Melbourne’s oldest suburbs. Richmond is an area which, like many other inner suburbs in Australia’s major cities, been a place of continuous and diversified immigrant settlement. Because of this, the area provides a useful vehicle to track the impact of demographic change on the built environment and how this relates to overall definitions of an area’s cultural identity. Material for this paper (apart from that derived from cited sources) was gathered from an extensive survey undertaken by the author in 2009. This survey involved photographic recording of residential buildings in Richmond, and their categorisation according to age and stylistic characteristics. These characteristics are detailed in the following paragraphs.

Richmond lies only a few kilometres from the centre of Melbourne. Its land was traditionally inhabited by the Wurundjeri people. There are still remnants of their material culture such as the corroboree tree at Burnley Park near the banks of the Yarra River, once an important meeting and ceremonial place for local clans. It was founded as a colonial settlement in 1839, when Robert Hoddle, also Melbourne’s surveyor, subdivided the area into farmlet allotments. By the 1850s, further subdivisions had led to the establishment of retail and commercial strips on Bridge Road and Swan Street, its two main east-west thoroughfares.

---

Richmond became a municipality in 1855, and by 1857 had a population of around 9,029. In these early years, there was some concentration of industry, but also a number of substantial residences were built in the prevailing Victorian styles. There are few surviving examples, including a gable-roofed brick villa at 207 Lennox Street constructed in 1855, and a pair of Victorian Gothic residences at 13-15 James Street, dating from 1857.

Gradually Richmond developed in the late nineteenth and early twentieth century into a combined residential-industrial suburb. On almost three sides, its boundary was the meandering Yarra River, on the banks of which were established many of Melbourne’s mills and factories. Nearly all settlers during this period were from Britain or Ireland, and as in other parts of the city, the main social distinction became that between Protestants (mostly of English descent) and the mostly Irish-descended Catholics. Richmond became a local centre for Catholicism, as Catholics made up a large number of the workers in its new factories. While a small elite of factory owners and clergy lived on Richmond Hill, the suburb’s only elevated land, these workers generally lived in tiny cottages on its flood-prone flatlands. Their small houses were generally constructed, as was common across Australia at the time, of light timber framing, clad in weatherboards. These were utilitarian buildings, with decorative details like multi-paned windows and verandas with cast iron lacework confined to their narrow street frontages. As Richard Twopeny, in his 1883 account of *Town Life in Australia* noted;

![Figure 1: Victorian-era Cottages in Richmond (Bottom Right are Residences at 13-15 James Street)](image)

---

By far the majority of houses are built by speculators; which means that they are very badly built, run up in a tremendous hurry, constructed of the cheapest and nastiest materials, with thin walls – in short, built for show, and not for use.11

As many of working-class residents living in these buildings were reduced to abject poverty by the 1930s depression, Richmond gradually became a slum district, considered to be the domain of the impoverished and the criminal.

In 1954, when a Hawthorn woman was fined £5 for failing to stop after an accident, she tendered as her defence; “My only thought was to get home safely. I was very frightened as there had been so many bandits in the Richmond district, . . . I just kept going, wanting to get out of Richmond where the bandits seem to live”.12

The area was the focus of the slum abolition movement of the 1940s and 1950s, led by Oswald Barnet and the local Herald newspaper.13 State governments of the time agreed, and worrying about a broader population decline in Melbourne’s inner suburbs, the Melbourne Metropolitan Board of Works’ 1954 Master Plan recommended “comprehensive redevelopment” as the solution.14 For Richmond, this meant the demolition of large numbers of mostly Victorian-era houses in order to construct new public housing, the most prominent example being the high-rise towers of the North Richmond’s Housing Commission estate, commenced in 1964. This thinking correlated with what was happening in many other cities of the Western world. Inner suburbs were generally considered to be undesirable places to live, and it was considered inevitable that the middle classes would abandon the older, more cramped inner parts of the city for its newer, more spacious outskirts.15 In a future where the automobile would free individuals to travel from their modern homes in safe, outer suburbia via the new infrastructure of roads and freeways to their workplaces, it was common wisdom that the inner city would be left to the underclasses and those who for some reason rejected such progress; recent migrants, low-waged workers, the aged, and a few artists and other bohemians.16

During this time, most of Richmond’s wealthier residents did take the opportunity to relocate to newer suburbs on the growing edge of Melbourne’s metropolitan area, and 1959 alone about a tenth of Richmond’s housing stock were sold.17 Most of people who came to occupy these houses were newly arrived immigrants from southern Europe (mostly from Greece, but also from Italy, Turkey, Malta and Lebanon), settling in the area because housing was cheap and employment was nearby. The 1961 Census found that 40% of Richmond’s population were southern-European-descended ‘New Australians.’ The area around Swan Street in south Richmond became a centre for Greek-Australian businesses, and Orthodox Churches and other culturally specific institutions were established. With the full relaxation of the infamous Immigration Act in the 1970s, settlers also began to arrive from Asia. The

14 Logan, W., The Gentrification of Melbourne: A Political Geography of Inner City Housing, (St Lucia, University of Queensland Press, 1985), p.150.
war in Vietnam provided the main influx, and Richmond, with large quantities of public housing, became one of the main locations for Vietnamese refugee settlement. The retail district of Victoria Street adjacent to this public housing has since developed into a major centre for Vietnamese-Australian commerce.

The 1970s also saw the beginnings of the gentrification of the area, as the Anglo-Celtic middle-classes gradually revised their views on the inner suburban living. This process has continued to the present-day, especially since the recovery from the 1990s recession. Now Richmond is, for the first time since the early years of its white settlement, considered to be one of Melbourne’s more desirable areas in which to live. This process has, of course, led to dramatic increases in property values, with the corollary that the proportion of Richmond’s residents who are working-class and/or immigrant is in gradual decline. The Vietnamese identity of north Richmond is still relatively strong (as blocks of public housing remain), many of the second and third generations of the suburb’s southern European settlers have dispersed into the wider metropolitan area as they have either sold their families’ properties or been priced out of the rental market.

**Architectural Alterations**

So what of residential buildings in this context? Do they speak of a kind of cultural dialogue, illustrative of the area’s cultural and societal changes? Exploration of these questions first require a brief description of the physical and spatial changes undergone by buildings, and the correlation between these and the changing nature of settlers who have undertaken these changes.

There were a number of characteristic alterations to residences made as new migrants from Southern Europe occupied Richmond’s houses in the 1950s to 1970s (Figure 2). As speculatively-built houses in an impoverished area, many buildings were in poor repair, and many of these alterations were practical. One of the most common was replacement of the narrow timber-framed front window, by wider ones framed in aluminium. The new, wider windows allowed more light into their dark interiors. Elaborate Victorian-era veranda roofs, with cast-iron lacework and curved corrugated iron roof sheeting, were often removed, and replaced by simpler structures with flat roofs supported on slim metal struts, or sometimes open pergola framing. Veranda floors, traditionally surfaced with tiles or timber boards, were replaced with concrete slabs. The new settlers also made use of the space between the house and the street (if any) for food plants; tomatoes, grapes, lemons. They grew grape vines on the new lightly-framed porches, which provided shade in summer, and sun penetration in winter. The dilapidated weatherboards covering the exterior walls might be clad in a skin of brickwork, which both protected deteriorated areas, and also gave buildings a more modern aspect, one that appealed to settlers used to more solid building traditions.
Where this was impractical or too expensive, aluminium siding panels, or cement-sheet cladding with imitation-brick patterning were used. To modernise masonry houses, elaborate parapets were removed, and exterior walls painted white or in pale colours. Some houses were completely demolished, and their replacements were mostly constructed in the prevailing brick veneer style of 1950s Australian outer suburbia. This style tended to be austere in detail, with exterior walls of salmon or cream brick, wide aluminium-framed windows, characteristically on the front corners of the house, and shallow-pitched cement-tiled roofs. Often the layout was ‘double-’ or ‘triple-fronted’, with the first ‘front’ or bay containing the main living area, with the front door housed in a second ‘front’ set further back.

However, on larger plots of land, grander residences were constructed that expressed more fully the aesthetic and material preferences of their inhabitants (Figure 3). These were often double-storey, again constructed of brick, but made more imposing by the addition of front verandas or balconies, framed with brick arches or columns cast in concrete to emulate Greek or Roman antecedents. Similarly, concrete balustrading to stairs and balconies mimicked Classical forms. Decorative concrete eagles, lions or other heroic beasts placed atop gateposts would complete an impression of solidity, grandeur and material success.
While these houses have become synonymous with Southern European migrants, and sometimes pejoratively labelled ‘wog palaces’, houses modified or constructed near the Vietnamese area of Victoria Street in north Richmond have displayed slightly different, but also quite distinctive characteristics (Figure 4). Often rendered and painted in pale colours, these residences are also usually, two-storey. They also generally have second-storey balconies, though unlike those of Southern European migrants these balconies are usually set back from the lower storey. Concrete or steel balustrading is common, and exterior paved

18 <http://www.guardian.co.uk/world/2001/mar/26/worlddispatch>
areas are often decorated with ornamental plants in pots. Security tends to be prominent, with trellis doors and steel gates barring both the property and openings to the house. It is also not uncommon for commercial uses to occupy the ground floor, usually the businesses of the inhabitants above.

Figure 5: Contemporary Residences in Richmond

Figure 6: Restored Victorian- and Edwardian-era residences in Richmond

The gentrification of Richmond, and its rediscovery by the Anglo-Celtic middle-class has led to further alterations to its architectural landscape. A diverse range of stylistic approaches can be found in the area’s newer residences, reflecting prevailing architectural idioms and
popular tastes. Houses built recently have been in styles ranging from rectilinear neo-Modern to revivalist neo-Victorian (Figure 5).

This period has also seen an increasing interest in restoration and renovation of Richmond’s actual Victorian- and Edwardian-era building stock (Figure 6). In 1985 the first comprehensive study of the area’s built heritage was produced, the Richmond Conservation Study. This has been more recently augmented by further studies, in 1998 and 2007. The Richmond Conservation Study, apart from identifying buildings in the area considered worthy of conservation, also set out guidelines for the restoration of old buildings, specifying materials, details and paint colours that it deemed suitable for the architecture of particular eras, aligned with similar state, national and international guidelines. The result has been that, encouraged by local government, and changing popular taste (which, in the new gentrified Richmond, has had much greater import for local property values) many of Richmond’s cottages and terrace houses have been restored according to the study’s criteria. They have been taken back, as it were to their ‘original’ states, or chronologically determined approximations thereof. For the remaining un-renovated houses from Richmond’s colonial origins, this development has been undoubtedly welcome. Buildings that were previously unappreciated are now meticulously restored. Embodiments of nineteenth century working-class culture are now seen to be valuable.

However, this process of restoration has not just been applied to the few un-renovated Victorian-era residences in the area, but also on those houses altered in the 1950s to 1970s. In some ways it is not surprising that governmental appreciation of Richmond’s architecture remains concentrated on what remains of its ‘original’ late nineteenth and early twentieth century building stock. As Worthing and Bond point out,

In the early days of the conservation movement there was a very strong emphasis, often to the exclusion of any other considerations, on the need to protect the original and/or authentic fabric of the structure, based on the idea that it represented the skill and art of the originator and, as mentioned previously, that age in itself conveyed cultural worth. This ‘archaeological’ perspective is still a strong theme today, and appropriately so – at least for certain buildings and certain situations.

However, this enthusiasm for restoring buildings back to their ‘original’ form raises questions about cultural priorities. Does it mean that the last fifty years of Richmond’s constructed history, the period in which its population has greatly culturally diversified, should be erased where it compromises the record of earlier times”? Do migrant alterations to buildings have their own cultural value? In the 1970s, as Richmond was beginning to be gentrified, some noted that migrant cultures had become integral to the overall identity of the area, and were in danger of being erased. In a 1978 seminar on the inner suburbs, the following point was made.

---

20 City of Yarra Heritage Review: Thematic History, (City of Yarra, Richmond 1998); City of Yarra Review of Heritage Overlay Areas (City of Yarra, Richmond, 2007).
…perhaps planning should abandon this concern or obsession with physical things and try to control the sociological composition of the city. The implication of that would be that if you bought in to, say, Richmond with the expectation of having an urban or a certain mix of population there in terms of the percentage of Greeks and labourers and so forth, then you should be able to complain to the planning authority if you think there are too many trendyies moving into the area. There could be “Trendy Appeals Board”, where you could go and put your case and so you could envisage having advertisements for houses saying, “Migrants only.”

Despite this, local Heritage documents have, since their inception in the 1980s, maintained an ‘archaeological perspective’. The Richmond Conservation study of 1985 determines the following; “… imitation bricks, imitation stone facing, imitation roofing tiles and aluminium or plastic weatherboards are not convincing and detract from the authentic overall appearance of a building,” and furthermore; “… weatherboards should not be finished in brick, imitation or real.” Also, “ALTERED WINDOW OPENINGS are generally assessed as ‘Extremely inappropriate’,” and, “In all cases, where visible from the street, the original windows should be retained or reinstated.” Similar comments are made about veranda alterations, front fences and other additions likely to have been made by immigrant residents. While this definitive tone is not repeated in more recent publications on local built heritage, the 1985 Study remains a current reference, freely available from the local government’s website.

The 1998 Thematic Study and its 2007 updating sometimes acknowledge post-war buildings or alterations to buildings, but ascribe them little importance. Urban Conservation Areas remain defined by the prevalence of un-altered, or ‘appropriately’ restored older buildings. The pejorative attitude towards the alterations carried out in this period obviously have something to do with both the increased appreciation for the old buildings that were altered, and aesthetic judgements about 1950s - 1970s adaptations. Judgement of an altered building is not just an aesthetic appraisal of physical and material characteristics, but also embedded in a philosophical view about the correct or appropriate way to interact with the ‘authentic’ original, in which re-application of Victorian-era paint colours, decorative details and window proportions are considered more appropriate than preservation of newer alterations.

However, increased interest in the restoration of the architecture of Australia’s colonial past has grown concurrently with the increasingly multicultural nature of its society. Given that it is impossible to disassociate changes to social composition and demography from the tangible reminders of these changes, does the desire to revert to origins also imply the reversion to a kind of nationalism based on the putative origins of white settlement in Australia? Melbourne architect Dianne Peacock makes this suggestion, arguing that a;

purge of migrant architectural intervention, driven by a concern for property values and middle class taste culture was, and still is, supported by institutionalised heritage controls.

---

These desires and controls, which despite any rhetoric of cultural diversity, continue to preserve and reproduce almost exclusively, a select built heritage of the prevailing culture.\(^{29}\)

The presence of buildings altered or constructed in the post-war period represents a process of negotiation over issues of symbolism, culture, ethnic identity and land usage. The collective built environment that has evolved (and is still evolving) out of these negotiations is arguably the physical manifestation of how Australian culture as a whole is developing out of the blending and mixing of different identities. So in a pluralistic society, is restoration back to an ‘original’ state culturally sustainable? In other facets of contemporary culture, this is much less of an issue. The Greek cafes, shops and other businesses in the Swan Street/Burnley Street area and the more extensive Vietnamese precinct on Victoria Street, are enthusiastically promoted by both local and state governments as being representative of Melbourne’s multicultural nature. Diversity is celebrated and encouraged. However, the relationship of cultural sustainability to the wider Australian built environment remains contested territory. Here, there still remains the spectre of the unitary nation, with its assumptions about clearly defined and defended territories of identity and belonging.

There are, of course, many factors that influence the built environment. Further understanding of the changes that have taken place within Richmond’s houses could be derived from closer analysis of the suburb’s changing social customs and ways of life; whether through tracking changes in economic status of the suburb’s inhabitants (e.g. buildings may have been constructed by landowner-farmers in the 1850s, lived in by impoverished factory workers in the 1930s, and later renovated by upwardly-mobile professionals in the 2000s); changes in the ethnic backgrounds of buildings’ inhabitants and consequent alterations in the use of spaces (e.g. the Anglo-Celtic settlers’ use of the front garden for ornamental planting, compared to Southern European settlers using the same space for growing edible crops); analysis of broader societal trends and changing tastes (e.g. the general enthusiasm for modernity in the 1960s compared to the interest in built heritage in the 1980s); or just through the impact of general advances in residential architecture (e.g. the gradual incorporation of indoor toilets, kitchens and laundries into Richmond’s houses during the twentieth century). In terms of the impact of migration on Australian architecture, houses altered by migrants from particular cultural backgrounds could be compared to contemporaneous architectural developments in their countries of origin, or with those from other locations where migrants of the same background have settled. The notion of a shared cultural heritage must draw on all these disparate factors if it is going to be representative of more than a minority of the area’s inhabitants.

In a broader sense, this discussion, concentrated as it is on the residential architecture of a small area of an Australian city, can only emphasise the richness of built culture in a contemporary multicultural society, and provoke further study into the notion of cultural sustainability in such an environment. If cultural sustainability is going to be progressively defined, and the Kanazawa Resolutions’ concept of ‘dialogical coexistence’ is probably the most progressive definition that currently exists, then further studies are urgently needed. This is because contestations within Richmond’s built environment are not unique, or even peculiar to Australia. They have their parallels in many other parts of the world, especially in countries

whose populations have become increasingly diversified through recent immigration. The cultural and architectural critic Kazi Ashraf has noted that; ‘The new battle ground is not merely between East and West, but between essence and fragmentations’,

but for the culture of a place to be sustainable, I would argue that it needs to embrace both. While sustaining the culture of built environments inevitably involves a degree of preservation, in a diversified society a way between essence and fragmentation is needed to ensure that sustaining the built culture of one of its constituents does not mean the erasure of others.

About the Author

Dr. David Beynon

Dr. David Beynon’s current research involves investigating architecture as a social and cultural practice, particularly in the context of Australia’s engagement with Asia and the architectural implications of migration and hybridity. His writing includes ‘Architecture Ex-Patriota’ in the journal Interstices (2008) and ‘Melbourne’s ‘Third World-Looking’ Architecture’ in the book suburban Fantasies: Melbourne Unmasked, (2005). He has also recently completed in an ARC Discovery Project ‘The Influence of Indian Antecedents on the Geometry of Southeast Asian Temples’ and is currently involved in the ARC Linkage Project ‘Strategic Assessment of Building Reuse Opportunities’. Dr. Beynon lectures in the areas of Architectural Design, Architectural Practice and Asian Architecture. He is also a registered architect. He received his B.Arch (Honours) from University of Melbourne in 1990, and has practised in Melbourne, Brisbane and Singapore. He maintains a link to practice through AlsoCAN Architecture and Interactive Design, which investigates the design of insertions, adaptations and urban interventions, including shopfront-grafted home-offices, East-West hybrid courtyard buildings, and mobile office-dwellings.
